BladderScan i10 – designed to withstand probe drops

In a normal day, a bladder scanner is pushed, pulled, bumped and the probe may even be dropped, as it is moved through the hectic world of the hospital corridor. Damaged equipment can cause delayed patient care due to downtime.

To meet the challenges of the hospital floor, the BladderScan i10™ probe has been purposefully designed and then rigorously tested to the rugged military standard drop test, MIL-STD-810H¹.

The result? You can have confidence Bladderscan i10 will meet the demands of your team. Reducing downtime and keeping users focused on the patient – not on managing the equipment.

1. Probe designed to withstand multiple drops at 1.22 m (4').
Test does not imply product durability under all conditions.
